---

Cyanosis, poor perfusion.

5. If oxygen is used it must be both warmed and humidified.

6. Baby should be wrapped for transport to the nursery and transported on the radiant warmer.

7. Nursery room temperature should be maintained at 74-78 degrees.

8. On arrival the baby is again exposed on the radiant warmer on servo control set at 36.5 and initial assessment performed including rectal temperature. Vital signs (pulse, respirations, blood pressure) are taken every 15 minutes for one hour or until stable.

9. After the initial assessment all temperatures should be
